

Garden in a Glove

In each finger of the glove,
you'll grow a different type of plant.

Procedure

1. Label each finger with the type of seeds that you will put in that finger.
2. Take two cotton balls and dip them in water. Squeeze the cotton balls to remove excess water.
3. Place two or three seeds of each type into the cotton balls and place the cotton balls into the fingers of the glove. If you labeled the fingers, make sure the correct seeds go into each finger!
4. Blow a small amount of air into the glove and close it with a twist-tie or pipe-cleaner.
5. Tape or hang the glove in a warm spot (like in a sunny window) and watch the seeds sprout.

Observations

Record the growth of the seeds.
Which grows first? Which grows the longest?

Two or three days after the seedlings sprout, cut off the tips of the fingers and plant the seedlings, cotton ball and all. If you leave the seedlings in the glove, they will eventually run low on air, water and nutrients.
