

Hand Copter

Have you ever noticed maple tree seeds fluttering to the ground in the spring? They are fascinating to watch as they twirl downward in a helicopter motion. You can make a hand copter that works in much the same way.

Materials

- Hand copter template
- Scissors
- Paper clip

Procedure

- Cut the copter along the dotted lines. (The solid lines are fold lines.)
- The two flaps at the top are the copter blades. Fold one flap forward, the other backward.
- Fold the side flaps at the bottom to make a 'T' shape.
- Place the paper clip at the bottom of the 'T'.

Procedure

- Let it go from the top of the stairs or any place fairly high above the ground.
- You can also try throwing it up in the air and watching it twirl down.
